ABSTRACT

The domination polynomial of a graph G of order n is the polynomial $D(G,x) = \sum_{i=\gamma(G)}^{n} d(G,i)x^i$, where $d(G,i)$ is the number of dominating sets of G of size i, and $\gamma(G)$ is the domination number of G. The roots of domination polynomial is called domination roots. In this article, we compute the domination polynomial and domination roots of all graphs of order less than or equal to 6, and show them in the tables.

1 Introduction

Let $G = (V, E)$ be a graph of order $|V| = n$. For any vertex $v \in V$, the *open neighborhood* of v is the set $N(v) = \{u \in V | uv \in E\}$ and the *closed neighborhood* of v is the set $N[v] = N(v) \cup \{v\}$. For a set $S \subseteq V$, the open neighborhood of S is $N(S) = \bigcup_{v \in S} N(v)$ and the closed neighborhood of S is $N[S] = N(S) \cup S$. A set $S \subseteq V$ is a dominating set if $N[S] = V$, or equivalently, every vertex in $V - S$ is adjacent to at least one vertex in S. The domination number $\gamma(G)$ is the minimum cardinality of a dominating set in G. For a detailed treatment of this parameter, the reader is referred to [9]. Let $\mathcal{D}(G,i)$ be the family of dominating sets of a graph G with cardinality i and let $d(G,i) = |\mathcal{D}(G,i)|$. The *domination polynomial* $D(G,x)$ of G is defined as $D(G,x) = \sum_{i=\gamma(G)}^{|V(G)|} d(G,i)x^i$, where $\gamma(G)$ is the domination number of G ([8]). A root of $D(G,x)$ is called a *domination root* of G.

We can obtain some information about a graph, by using its domination polynomial. (See [1]). Similar to another graph polynomials, it is natural that, we have a atlas for domination polynomial and domination roots of graphs with order at most 6. For more information on these subjects refer to [1, 2, 3, 4, 5].

In this paper, we obtain the domination polynomials and domination roots of all connected graphs of order one to six. Let us to say that, these tables has published in [6, 7]. Thanks to ArXiv for letting us to publish them for more access. Note that for disconnected graphs, we can use the following theorem:

Theorem 1.([8]) *If a graph G has m components $G_1, \ldots, G_m$, then $D(G, x) = D(G_1, x) \cdots D(G_m, x)$.*
